- ◆ Banks and Credit Unions

Palmetto Microfilm Systems, Inc. (PMSI) has been serving its customers in South Carolina, North Carolina and Georgia for over 30 years. We have the experience, expertise and products to offer your organization an affordable solution customized to meet your specific needs and requirements. Furthermore, we have teamed with industry-leading software and hardware providers and have knowledgeable staff to integrate these products to give you a complete, turn-key solution. Below is a brief description of our product offerings.

EMC² ApplicationXtender

The ApplicationXtender (AX) suite of products from EMC² is the core software in our document management system solution. It provides for scanning, indexing and retrieving documents as well as a secure interface to your documents through either a desktop or web client. Other modules include Report Management to automatically capture and index data reports and Workflow for document routing. Furthermore, using tools designed by PMSI, many of your existing host applications can be imaged enabled to allow for the automated viewing and indexing of documents based on data found on the host application screens.

Canon Scanners and Micrographics

PMSI has been an authorized Canon dealer for over twenty seven years. We offer the complete line of Canon scanners ranging from 25 ppm up to 90 ppm with color and black and white capability. PMSI is also the only authorized reseller for Canon's line of Microfilm Scanner products and maintains a certified staff of technicians to provide quality service to all Canon equipment we sell.

Cardiff Teleform

Cardiff Teleform allows for the scanning and data capture of documents. Using Optical Character Recognition (OCR) technology, Teleform reads index data from structured and unstructured documents and imports the document images and their indexes into the AX repository as well as automatically updating host systems with the extracted values. This streamlines the document capture process with little manual intervention.

Cardiff LiquidOffice

Cardiff LiquidOffice is an on-line form and business process management system. LiquidOffice redefines business process management in the enterprise by accelerating cycles, ensuring compliance, and connecting people with information and processes, regardless of location. LiquidOffice also enforces adherence to best practices, corporate policies and government regulations by centralizing processes and control structures across the enterprise.

VSoft Check Capture and Remittance Processing

VSoft provides software for check capture and remittance processing. VSoft's check capture software allows for financial institutions to capture check images and transaction information and deliver these items electronically, reducing processing and transportation costs. VSoft's remittance processing module allows for organizations to quickly and accurately capture payment information, update existing financial host systems and transmit payment information electronically to financial institutions. Used in applications such as tax collections or utility payments, this module significantly decreases payment processing and posting time and makes funds available much sooner.
